The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human collapse and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnost a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorder, endocrine of sutoimmus/inflammatory disorder, developmental disorder, endocrine disorder, neurological disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp collections may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline gene therapy. The present sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in cinvention the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gietzen D;
in diagnosing a condition, disease or disorder associated with human molecules, e.g. autoimmune or inflammatory disorders, in gene therapy or in gene mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New diagnostic and therapeutic polynucleotides and polypeptides, useful in diagnosing a condition, disease or disorder associated with human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Schmidt JP, Wright RJ, Bruns CM, Marjanovic MM, Shen F;

                                                          The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A pull purincleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine autoimmune/inflammatory disorder, developmental disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp conflections caused by virus, bacteria, fungi or parasite. The dithp collymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline gene therapy. The present sequence represents a dithp protein of the cinvention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ä

The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, autoimmune/inflammatory disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parable. The dithp molecules may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline gene therapy. The present sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; anti-HIV; antiallergic; cerebroprotective; antiparkinsonian; anticonvulsant; nootropic; neuroprotective; immunosuppressive; dermatological; anti-inflammatory; cytostatic; antiarteriosclerotic; gene therapy; cell adhesion; extracellular matrix; CADECM; immune system disorder; AIDS; allergy; neurological disorder; stroke; parkinson's disease; epilepsy; developmental disorder; bown's syndrome; cerebral palsy; connective tissue disorder; systemic lupus erythematosus; genetic disorder; Alport's syndrome; cell proliferative disorder; cancer;

The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A selected from one of the 2722 sequences defined in the specification. A diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnost and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnost a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorder, endocrine disorder, neurological disorders, developmental disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp concludes may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

composition comprising an agent that differential tends then of the composition comprising an agent that differentially lab. The sting hereditary lymphoedema comprises lymphoedema comprises identifying a human subject with lymphoedema and with a mutation in at least one allele of a gene encoding a LEC protein, where the mutation in at least one allele of a gene encoding a LEC protein, where the mutation in at least one allele of a gene encoding a LEC protein, where the mutation correlates with lymphoedema in human subjects, and with the proviso that the LEC protein is not VEGFR-3; and administering to the subject a composition comprising a lymphatic growth agent selected from VEGF-C VEGF-D polypeptides and polynucleotides. The invention may be useful for the development of compounds with an antiangiogenic, cytostatic, vasotropic or antiinflammatory activity or for gene therapy. The method is useful in modulating the growth or differentiation of blood endothelial cells or lymphatic endothelial cells, in treating hereditary predisposition to the disorder or in monitoring the efficacy or toxicity of a drug on endothelial cells. The agent is useful in manufacturing a medicament for the differential modulation of blood sessel endothelial.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                     cell or lymphatic vessel endothelial cell growth or differentiation. The lymphatic growth agent may also be used in manufacturing a medicament for the treatment of hereditary lymphoedema resulting from a mutation in a LEC gene or of other diseases involving the lymphatic vessels, such as various inflammatory diseases and cancer metastasis via the lymphatic system. The present sequence is that of a human LEC/BEC differentially expressed protein which is related to the method of the invention. Note:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; secreted protein; diagnosis; antiarthritic; immunosuppressive; antirheumatic; antiproliferative; cytostatic; cardiant; vasotropic; cerebroprotective; noctropic; neuroprotective; antibacterial; virucide; fungicide; ophthalmological; vulnerary; gene therapy; autoimmune disease; hyperproliferative disorder; neoplasm; cancer; cardiovascular disorder; cerebrovascular disorder; angiogenesis; nervous system disorder; infection; ocular disorder; angiogenesis; nervous system disorder; infection; ocular disorder; angiogenesis; nervous system disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence does not appear in the specification but was obtained by the indexer using the source data given in table 14 of the specification
or differentiation of blood endothelial cells (BEC) or lymphatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The polynucleotide sequences given in AAC59449 to AAC59497 encode the human secreted proteins given in AAB34092 to AAB34140. AAB34141 to AAB3416 represent human secreted polyneptide sequences and proteins conditions. Human secreted proteins have activities based on the tissue and cells the genes are expressed in Examples of activities include: cand cells the genes are expressed in Examples of activities include: cardiant; vasotropic; carebroprotective; nootropic; cardiant; vasotropic; carebroprotective; nootropic; cardiant; vasotropic; carebroprotective; nootropic; cardiant; vasotropic, carebroprotective; nootropic; cardiant; vasotropic, carebroprotective; nootropic; cardiant; vasotropics and vulnerary. The polynucleocides and polypeptides can be used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used to pathological condition. Disorders which are disorders e.g. neoplasms or cancer of the breast or liver, cardiovascular disorders, cerebrovascular disorders, urruses and fungi and ocular disorders, infections caused by bacteria, viruses and fungi and ocular disorders, infections caused by carents skin aging due to sumburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used to and wound healing and epithelial cell proliferation, to regenerate telesues and in chemotaxis. The polypeptides can also be used to and wound healing and epithelial cell proliferation, to respect interase storage capabilities. AAC59440 to AAC59448 and AAB34091 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             soft tissue sarcoma; cytostatic; gene therapy; vaccine; screening; human.
                              New isolated nucleic acid molecules encoding 49 human secreted proteins used for preventing, treating or ameliorating medical conditions, for diagnosing pathological conditions or as food additives or preservatives.

The invention relates to a novel method for detecting soft tissue sarcoma which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcome ample indicates the presence of soft tissue sarcome. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acts sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated protein of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.
  Early detection of soft tissue sarcoma comprises determining expression of a gene in a first soft tissue sample and a normal soft tissue sample and comparing the gene expression, also useful in treating soft tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated nucleic acid molecule encoding a Schistosoma mansoni protein, or its portion which is at least 20 amino acids in length. Also included are an expression vector comprising the
soft tissue sarcoma comprises determining expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Kawano T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

transformed/transfected with the nucleic acid (or expression vector), an transformed/transfected with the nucleic acid (or expression vector), an immunogenic composition comprising the nucleic acid in combination with a pharmaceutical adjuvant or carrier, an isolated S. mansoni protein comprising comprising the isolated S. mansoni protein, an impunogenic composition comprising the isolated S. mansoni protein, an isolated antibody which specifically binds to the isolated antibody, a protein, a hybridoma cell line which produces the isolated antibody, a method for determining a S. mansoni infection in a subject and a computer readable medium having recorded in it a nucleic acid molecule from S. mansoni genome. The nucleic acid molecule is useful for preventing, diagnosing, or treating S. mansoni infection (schistosomiasis). It can also be used as vaccine against S. mansoni. The present sequence is a Schistosoma mansoni protein of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was the contact of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the inven
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnost a sericular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorder, endocrine of succioname/inflammatory disorder, developmental disorder, or infections caused by virus, bacteria, fungi or parasite. The dithp conclectuals may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline gene therapy. The present sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New diagnostic and therapeutic polynucleotides and polypeptides, useful in diagnosing a condition, disease or disorder associated with human molecules, e.g. autoimmune or inflammatory disorders, in gene therapy or in gene mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Schmidt JP, Wright RJ, Bruns CM, Marjanovic MM, Shen F;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                8
                                          The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A propertie of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine disorder, developmental disorder, endocrine disorder, neurological disorder, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp infections caused by virus, bacteria, fungi or parasite. The dithp infections caused by virus, hadeering single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gietzen D;

tissues especially rheumatoid arthritis or osteoarthrosis. The method is also useful for detecting or monitoring connective tissue diseases especially chondrosarcoma, endosarcoma, coular disorders, endochondroma, chondrodysplasia and secondary chondrosarcoma. The use of antibodies provides for early and accurate diagnosis of cartilage related autoimmune diseases e.g. rheumatoid arthritis or other connective tissue disorders

The invention relates to novel diagnostic and therapeutic polymuclectides selected from one of the 2722 sequences defined in the specification. A polymuclectide of the invention may have a use in gene therapy. The human considers of the invention may have a use in gene therapy. The human considers of the sequence of the polymuclectides (dith) or polypeptides may be used to diagnostic and therapeutic polymuclectides (dith) or polypeptides may be used in muclections caused by virus, pacteria, dungi or parasite. The dithy infections caused by virus, bacteria, fungi or parasite. The dithy infections caused by virus, bacteria, fungi or parasite. The dithy infections caused by virus, bacteria, fungi or parasite. The dithy from minute biological samples, in detecting single nuclectide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Type IX collagen; alpha-1 chain; alpha-2 chain; alpha-3 chain; human; detection; autoimmune tissue; connective tissue; disorder; antibody; antigen-antibody complex; rheumatoid arthritis; osteoarthrosis; diagnosis; chondrosarcoma; endosarcoma; ocular disorder; endochondroma;

```
Schistosoma mansoni protein, or its portion which is at least 20 amino acids in length. Also included are an expression vector comprising the nucleic acid operably linked to a promoter, a recombinant cell transformed/transfected with the nucleic acid (or expression vector), an immunogenic composition comprising the nucleic acid in combination with a parameceutical adjuvant or carrier, an isolated S. mansoni protein comprising a mannor immunogenic composition comprising the isolated S. mansoni protein isolated antibody which specifically binds to the isolated S. mansoni computer cedable medium having recorded in it a nucleic acid and a computer redable medium having recorded in it a nucleic acid molecule from S. mansoni genome. The nucleic acid molecule from S. mansoni mifection in subject and a computer cedable medium having recorded in it a nucleic acid molecule from S. mansoni genome. The nucleic acid molecule is useful for preventing. It can also be used as vaccine against S. mansoni. The present sequence is a Schistosoma mansoni protein of the invention. Note: The sequence data for

Dias-Neto E,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gargioni C;
```

This invention describes the detection of an autoimmune/connective tissue disorder in a patient which comprises (a) reacting a sample with an antibody specific for type IX collagen (b) allowing (a) to form an antigen-antibody complex (c) measuring the complex and (d) comparing the results to a control, non-diseased serum sample to determine presence or progression of autoimmune/connective tissue disorder. The method is useful for detecting, diagnosing and monitoring diseases comprising the abnormal expression of type IX collagen in relevant body fluids or

Detecting autoimmune disorders and/or connective tissue disorders comprises determining levels of type IX collagen in serum.

The present invention describes a method for lowering circulating free fatty acid levels in an individual, which comprises administering a composition comprising a carrier and a homotrimeric gOBG3 (DBG3 globular domain) polypeptide fragment. Also described: (1) an isolated homotrimeric gOBG3 polypeptide fragment; (2) a composition comprising a carrier and the gOBG3 polypeptide fragment or polymolectide or vector; (3) an isolated polymolectide fragment or polymolectide or vector; (3) an isolated polymolectide fragment; (4) a vector comprising the gOBG3 polypeptide fragment; and (5) a transformed host cell comprising the gOBG3 polypeptide fragment; and (5) a transformed host cell comprising the vector. OBG3 has antilipaemic, antiarteriosclerotic, antidiabetic and hypotensive activities, and can be used in gene therapy. The method is useful for lowering circulating free fatty acid levels for reducing body mass, maintaining weight loss or for treating obesity.

The present sequence is used in the exemplification of the

present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human moleoules, e.g. cell proliferative disorder, esociated autoimmune/inflammatory disorder, developmental disorder, endocrine disorder, neurological disorders, gastrointestinal disorders, or
This sequence is the human alpha-2(IV) collagen protein which is used to analyse a novel human alpha-6(IV) collagen protein encoded by the COL4A6 gene. The alpha-6(IV) protein can be used for disposis to gene therapy of diseases associated with collagen type IV pathology, especially Alport's syndrome and associated diffuse leiomyomatosis. The polypeptide may also be used for generating monoclonal or polyclonal antibodies having specificity for the alpha-6(IV) polypeptide especiality an antibodie that is not crossreactive with other collagen proteins including alpha-1(IV), alpha-2(IV) and alpha-5(IV) collagens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gietzen D;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New diagnostic and therapeutic polynucleotides and polypeptides, useful in diagnosing a condition, disease or disorder associated with human molecules, e.g. autoimmune or inflammatory disorders, in gene therapy or

infections caused by virus, bacteria, fungi or parasite. The dithp molecules may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline gene therapy. The present sequence represents a dithp protein of the invention. Note: The sequence date for this parent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapy the plynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorder, endocrine autoimmune/inflammatory disorder, developmental disorders, endocrine disorder, neurological disorders, asstrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. molecules may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline gene therapy. The present sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAW18642-AAM42213) with nootropic, manusosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Wang D;

The present invention relates to a method for the in vitro diagnosis of endometriosis by determining the amount of gene product from at least one specific gene in a patient sample and comparing this with the amount of gene product in a patient sample. A reduced level is indicative of endometriosis. The gene products may be fibronectin, p27, reticulocalbin, aludiny—11ke growth factor binding protein-2, alpha-2 type IV collagen, transmembrane receptor PTK7, collagen type XVIII alpha 1, platelet protein patient growth factor receptor alpha, laminin M chain, subtilishe like protein PACS4 or nidogen. The method is useful for initial diagnosis of endometriosis, and also for monitoring progress and treatment of the
                                                                                                                                                                                                                                                                                         ö
system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system disease, such as Alzheimer's, Parkinson's disease, amyotrophic lateral solerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and thrapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, endometriosis; DNA chip; fibronectin; p27; reticulocalbin; aldehyde dehydrogenase 6; gravin; phospholipase C epsilon; elastin; insulin-like growth factor binding protein-2; alpha-2 type IV collagen; transmembrane receptor PTK7; collagen type XVIII alpha 1; platelet derived growth factor receptor alpha; laminin M chain; subtilisin like protein PACE4; nidogen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             In vitro diagnosis and monitoring of endometriosis, comprises detecting reduced expression of specific gene products, e.g. from the fibronectin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Haendler B, Kraetzschmar J, Kreft B, Winterhager E;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel isolated polynucleotide and the encoded polypeptide. The molecules of the invention demonstrate antinflammatory, neuroprotective, antianaemic, cytostatic and vulnerary activities and may be useful in preparing a composition for diagnosing or treating inflammatory, haematopoietic, immune, neurodegenerative or stem cell disorders, such as aplastic anaemia or cancer, as well as for promoting wound healing. The molecules may also be utilised during gene therapy procedures. The current sequence is that of a human therapeutic protein of the invention. The current sequence is not shown explicitly within the specification but can be accessed from the WIPO web-site.

The invention relates to an isolated peptide or peptidomimetic (I), comprising a fully defined 5 amino acids sequence (Cys-Arg-Glu-Lys-Ala) given in specification or its peptidomimetic, the peptide or peptidomimetic having a length of less than 100 residues. The peptide (I) can form part of a conjugate (II), comprising a therapeutic agent linked to the homing molecule (I) that selectively homes to tumor vasculature, to the homing molecule (I) that selectively homes to tumor vasculature, cancer chemotherapeutic agent, cytocoxic agent, anti-angiogenic agent, polypeptide, nucleic acid molecule or a small molecule. (II) is useful for reducing the number of tumor vessels e.g., breast tumor vessels in a subject, especially for treating cancer e.g., breast cancer. Amino acid sequence binding to the CREKA peptide sequence were isolated by screening a phage display expression library against immobilized CREKA peptide.
                                                            protein interaction; cytostatic; tumor; collagen; cancer; antiangiogenic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, prey, adipocyte; SID, selected interacting domain, anorectic, antidiabetic, protein-protein interaction, diabetes; yeast 2-hybrid assay; metabolic disorder; obesity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to a novel isolated nucleic acid associated with bronchial cancer comprising 489 defined sequences given in the pronchial cancer comprising 489 defined sequences given in the specification. The invention may be useful for the production of compounds with a cytostatic activity through the inhibition of expression or activity of tumour-associated proteins. The novel DNA sequences and the proteins/peptides encoded by them are used for detecting bronchial cancer or determining the risk of developing it and to screen for specific binding partners of the DNA or protein sequences, where the binding partners are potentially useful as agents for treating or used for prognosis, detection of metastases and for secondary treatment of tumours that have been stabilised or are no longer detectable).

Detecting abnormal expression of the DNA sequences provides early diagnosis of bronchial cancers. The present sequence is that of a protein encoded by a novel bronchial cancer-associated human gene sequence of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid, and derived proteins, useful for diagnosis of bronchial cancer and in screening for therapeutic and diagnostic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  01-SEP-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     05-SEP-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 23-AUG-2000
                                               02-AUG-2001
The invention relates to a complex between two interacting proteins in adipocyte cells, given in the specification. The proteins are identified by selecting a bait protein from a known adipocyte marker and then performing a yeast 2-hybrid selection to isolate prey proteins encoded by members of an adipocyte colls, solate prey proteins encoded by (RTM) (selected interacting domains) proteins. Also included are a polypeptide in the adipocyte cells, a recombinant host cell expressing at least one of the interacting compound in adipocyte cells, as included and polypeptide comprising any of the first action of the interacting cells, as SID (RTM) polypeptide comprising any of the 738 amino acid sequences given in the specification (including its fragment or variant), a SID (RTM) polynucleotide comprising any of the 738 nucleotide sequences given in the specification (including its fragment or variant), a vector comprising the vector, a protein comprising the polypeptides and a recombinant host cell comprising the vector, a protein comprising the polypeptides and compounds are useful for preventing or treating metabolic disorders such as obesity or diabetes. The polynucleotides are useful as probes or primers. The complex is particularly useful for identifying selected interacting domains (SID (RTM)) for screening drugs that modulate the protein interaction, thus complicing the therapeutic effect. The present sequence represents a SID (CT (prey)) protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; oxidoreductase enzyme; transferase; hydrolase; lyase; isomerase; ligase; hyperproliferative disorder; immunodeficiency disorder; autoimmune disorder; neurological disorder; metabolic disorder; inflammatory disorder; cardiovascular disorder; reproductive disorder; blood-related disorder; infectious disorder; infectious disorder; anticoagulant.
                                                                                                                                                                                                                  complex between two interacting proteins in adipocyte cells, useful identifying selected interacting domains that modulate protein stractions, or for preventing or treating metabolic disorders such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

(HUMA-) HUMAN GENOME SCI INC.

```
The present invention relates to the isolation of novel human enzyme polypeptides, and the cDNA (AAS40785-AAS41684) and genomic sequences encoding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, isomerases or ligases. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of a wide range of disorders including hyperprooliferative disorders (e.g. cancer), immunodeficiency disorders (e.g. AlbS) autcoimmune disorders (e.g. arthritis), neurological disorders (e.g. AlbEsimer's disorders (e.g. phenylketonuria), inflammacory disorders (e.g. asthma), cardiovascular disorders (e.g. atherosclerosis), blood-related disorders (e.g. haemophila), reproductive disorders (e.g. infertility) and infectious disorders (e.g. Influenza). The polymucleotides of the invention can also be used in gene therapy, AMO22915-AAU23814 represent the novel human enzyme polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                      Novel polypeptides and polynucleotides useful for diagnosing, preventing, treating neural, immune system, muscular, reproductive, pulmonary, cardiovascular, renal, proliferative disorders and cancerous diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; ovarian antigen; ovary disorder; breast disorder; neoplastic disorder; cancer; infectious disease; inflammatory disease; reproductive system disorder; autoimmune disorder; Alzheimer's disease; blood-related disorder; hyperproliferative disorder; hair loss; urinary system disorder; rathologated disorder; arrhythmia; respiratory disorder; cardiovascular disorder; arrhythmia; respiratory disorder; musculoskeletal system disorder; archythmia; neural activity disorder; neurological disorder; endocrine disorder; gastrointestinal disorder; liver disorder; pancreatic disorder; appliableder disorder; large intestine disorder; developmental disorder; inherited disorder; wound healing; skin aging; food additive;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  18-AUG-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                        18-APR-2002
The invention relates to isolated ovarian related polypeptide (ovarian antigen) comprising a sequence at least 90% identical to a sequence contriging a polypeptide fragment, domain, epitope or full length protein of a sequence (SI) appearing as ABG60239-ABG60296 having protein of a sequence (SI) appearing as ABG60239-ABG60296 having contein of a sequence (SI) appearing a RBG60239-ABG60296 having protein of a mainion or ameliates homologue of SI. Also included are the CDNA clones encoding the proteins of SI. SI, an anti-SI antibody and the CDNA are useful for diagnosing, preventing, captions diseases (such as ovarian Krukenberg tumour and cancer), infectious diseases (such as ovarian Krukenberg tumour and cancer), complastic disorders (such as ovarian Krukenberg tumour and cancer), complastic disorders (such as ovarian Krukenberg tumour and cancer), complastic disorders (such as ovarian Krukenberg tumour and cancer), complastic disorders (such as ovarian Krukenberg tumour and cancer), complaint of disorders (such as ovarian Krukenberg tumour and cancer), complaint of disorders (sickle cell anaemia), blood-related disorders (sickle cell anaemia), hood-related disorders (sickle cell anaemia), respiratory disorders (sickle cell anaemia), respiratory disorders (allowascular disorders (Allowascular disorders (Allowascular disorders (Allowascular disorders (Allowascular disorders (Allowascular disorders (Allowascular disorders (Allowascular disorders (Allowascular disorders (Allowascular disorders (Allowascular disorders (Allowascular disorders (Allowascular disorders (Allowascular disorders (Allowascular disorders (Allowascular disorders (Allowascular disorders (Allowascular disorders (Allowascular disorders (Allowascular disorders (Allowascular disorders (Allowascular disorders)) and antigen, such and antigen, such and antigen, such and antigen, such and antigen, such and disorders (Allowascular disorders) and antigen, such patent did not form part of the printed specification, but was for this patent did not form p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a complex between two interacting proteins in adipocyte cells, given in the specification. The proteins are identified by selecting a bait protein from a known adipocyte marker and then performing a yeast 2-hybrid selection to isolate prey proteins encoded by members of an adipocyte cDNA library. The proteins are designated SID members of an adipocyte cDNA library. The proteins are designated SID complexity (selected interacting domains) proteins. Also included are a polymetric encoding a polypeptide in the adipocyte colls, a recombinant host cell expressing at least one of the interacting polymeptides of the complex, selecting a modulating compound in adipocyte cells, a SID (RTM) polymetric comprising any of the 738 amino acid sequences given in the specification (including its fragment or variant), a vector comprising the vector, a protein chip comprising the polymetides and a recombinant host cell comprising all or part of the data, listed in the specification. Comprising the polymetides and a record comprising all or part of the data, listed in the specification. The comprising or treating metabolic disorders such as obesity or diabetes. The polymucleotides are useful for The polymucleotides are useful for The polymucleotides are useful for The polymucleotides or primers. The complex parts of the data is the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (RIM)) for screening drugs that modulate the protein interaction, thus sxhibiting the therapeutic effect. The present sequence represents a SID (prey) protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           C-propeptide; recognition sequence; procollagen; monomer chain; therapy; trimerised pro-alpha chain; fibril; procollagen suicide; wound healing;

This sequence represents a chimeric procollagen molecule of the invention. This sequence has the procollagen C-prepropeptide from the procollagen C-prepropeptide from the procollagen C-prepropeptide from the procession according sequence. The C-propeptide is implicated in the assembly of the monomer chains into crimerised pro-alpha chains prior to cleavage of the N- and C-propeptides and formation of collagen in fibril-forming pro-alpha chains. The C-propeptides determine the type-specific assembly of the molecties to which they are attached. The molecule of the invention comprises a first moiety they are attached. The molecule of the invention comprises a first moiety which is an alien collagen cativity attached to a second moiety, which is an alien collagen alpha-otain or a non-collagen material. The cover implant to promote (chronic) wound healing or fibrotic diseases with reduced scarring or for use in photography, brewing, cortaining substitutions in the recognition site, may have significantly caltered properties and characteristics, such as different binding containing substitutions in the recognition site, may have significantly containing substitutions in the recognition site, may have significantly containing substitutions in the recognition site, may have significantly containing substitutions in properties
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              C-propeptide; recognition sequence; procollagen; monomer chain; therapy; trimerised pro-alpha chain; fibril; procollagen suicide; wound healing; fibrotic disease; human.

The present invention relates to a tissue sealant composition comprises a crosslinking agent and a synthetic collagen or a synthetic gelatin in a dry state, they react with each other upon contact with an environment comprising a physiological pit to form a compound. The compound is useful to seal a wound comprising a surgical incision (comprising an angioplassy), laceration or a puncture and contains controlled and reproducible materials with minimal or no risk of infectivity and disease transmission. The present sequence represents the helical domain of type
                                                                                                                                                                   Tissue sealant composition comprises cross linking agent and a synthetic collagen or a synthetic gelatin in a dry state.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Collagen; antibody; immunoassay; metabolism; diagnosis; monitoring; disorder; osteoporosis; metastatic progression; Paget's disease; hyperthyroidism; bone; resorption; rheumatoid arthritis; osteoarthritis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Determination of collagen fragments in body fluids can be achieved by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Assaying collagen fragments in body fluid by immunoassay - using mantbodies raised against synthetic peptide(s) contg. potential crosslinking sites, to diagnose and monitor disorders of collagen metabolism, e.g. osteoporosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents a truncated procollagen pro-alphal(III) chain that can be used in the procollagen molecules of the invention. The C-
that can be used in the procollagen molecules of the invention. The C-
propeptide is implicated in the assembly of the monomer chains into
c trimerised pro-alpha chains prior to cleavage of the N- and C-propeptides
and formation of collagen in fibril-forming pro-alpha chains. The C-
propeptides determine the type-specific assembly of the moieties to which
they are attached. The molecule of the invention comprises a first moiety
having procollagen C-propeptide activity attached to a second moiety,
which is an alien collagen alpha-chain or a non-collagen material. The
covel collagen molecule can be used for treatment or diagnosis in humans
or animals, especially for the treatment of procollagen suicide, as an
adhesive or implant, to promote (chronic) wound healing or fibrotic
diseases with reduced scarring or for use in photography, brewing,

The present sequence is that of human type III collagen alpha-1. The invention is based on the discovery of the presence of particular collagen fragments in body fluids of patients compared with those of healthy subjects. These fragments are generated upon collagen degradation and are partly characterised by the presence of potential sites for crosslinking. A method for assaying collagen fragments in a body fluid sample is based on the competitive binding to immunological binding partners of collagen fragments in the sample and of synthetic peptides derived from collagen and containing crosslinkable sites (see AAV96118-21). When considering the degradation of type III collagen, the assay can be used as a means of identifying the presence of vasculitis syndrome
                                                                                                                                                                                                                                                                              ö
immunoassay using antibodies directed against synthetic peptides derived from collagen which contain sites of potential crosslinking. The method is used to diagnose and monitor treatment of discorders of collagen metabolism (degredation of type I collagen may indicate osteoporosis, metastatic progression, Paget's disease, hyperthyroidism or other conditions involving excessive bone resorption; degredation of type III collagen may indicate rheumatoid arthritis or osteoarthritis; and of type III collagen, vaculitis syndrome). The method can also be used to assess the toxicity of a compound and to test drugs for their effect on collagen metabolism. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Assaying type I collagen fragments for diagnosing osteoporosis in postmenopausal woman, involves contacting body fluid with synthetic collagen peptide and antibody and quantifying by competitive binding

The invention relates to a peptide synthesised to match an alphal(I) or alpha2(I) telopeptide component of a cross-linked telopeptide degradation calpha2(I) telopeptide component of a cross-linked telopeptide degradation or product of type I collagen. The method is useful for assasying to human collagen types I. II and III and for disgnosing the presence of disorders associated with the metabolism of collagen, especially osteoporosis. The peptide is used for assessing the impact of drugs on collagen metabolism. The peptide is useful in methods to assess an abnormal condition of a subject for e.g. excessive bone resorption which shows the presence of an cappide disease and hyperparathyroidism. Disease states involving connective tissues can be monitored by determining collagen degradation, connective tissues can be monitored by determining collagen degradation, connective tissues can be monitored by determining collagen degradation in examples are collagen type II degradation associated with rheumatoid continuously, application of these assays can also be used to monitor the progress of therapy administered to treat these or other conditions and as a measure of toxicity, since the administration of toxic subbtances of the nesults in tissue degradation. The present sequence is human collagen alphal (III) protein used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

The present sequence represents human collagen type II alphal. The specification describes a method for assaying type II collagen fragments in a body fluid sample. The method compities contacting the body fluid could sample. The method is partner. The method is useful for assaying vibthetic peptide consisting essentially of a type II collagen alphal amino acid sequence that competes with the collagen fragments for binding partner. The method is useful for assaying collagen fragments in body fluids. The method is particularly useful in assays for measuring bone resorption rates in patients or in collagen metabolism, especially in Paget's disease, Marfan's syndrome, osteogenesis imperfecta, neoplastic growth in collagenous tissue, collagen metabolism, especially in Paget's disease, Marfan's syndrome, osteogenesis imperfecta, neoplastic growth in collagenous tissue,

The method may be used for determining the degradation of human collagen of type I, II and III. It also can be used during clinical testing of new drugs to assess the impact of these druys on collagen metabolism. The assays, can be used as a measure of toxicity, since the administration of toxic substances often results in tissue degradation. Thus, the assays may be applied in any situation where the metabolic condition of collagen tissues can be used as an index of the condition, treatment or effect of substances directly administered to the subject or to which the subject is exposed in the environment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Assaying type II collagen fragments in a body fluid sample, for determining abnormalities in collagen metabolism, e.g. in Paget's disease or Marfan's syndrome, comprises contacting the fluid with a synthetic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method for assaying type I collagen fragments (I) in body fluid. The method involves treating the test sample with: (i) synthetic peptide, immobilised on a support; and (ii) immunological binding partner, reactive with the synthetic peptide, so that (I) and the synthetic peptide compete for binding, and (I) are quantified by measuring the binding partner to the synthetic peptide. The method is used to diagnose disorders of collagen metabolism, especially osteoarthritis but also Paget's disease, Marfan syndrome, osteogenesis imperfecta, neoplastic growth of collagenous tissue, dwarfism, rheumatoid arthritis or vasculitis, also for clinical testing of drugs to assess their effect on collagen metabolism. The present sequence represents the collagen type III-alphal protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Assaying type I collagen fragments in body fluid, useful for diagnosis and assessing treatment of e.g. osteoarthritis, by competitive immunoassay.
                                                                                                                                                                                                                                                                                                                 Collagen; osteoarthritis; Paget's disease; Marfan syndrome; dwarfism; osteogenesis imperfecta; neoplastic growth; rheumatoid arthritis; vasculitis; collagen type III-alpha1.

The present invention relates to a tissue sealant composition comprises a crosslinking agent and a synthetic collagen or a synthetic gelatin in a dry state, they react with each other upon contact with an environment comprising a physiological pH to form a compound. The compound is useful to seal a wound comprising a surgical incision (comprising an angioplasty), laceration or a puncture and contains controlled and reproducible materials with minimal or no risk of infectivity and disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Tissue sealant composition comprises cross linking agent and a synthetic collagen or a synthetic gelatin in a dry state.
                                                                                                                                                                                                                          Example 1 describes the determination of the presence of a mutation in the pro-alphal(III) gene. Primers used in PCR are given in AAQ30834-48. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                      Kit for detecting genetic pre-disposition for vascular aneurysms -contains primer 70 amplify portions of Type III procollagen DNA and detects mutation in standard procollagen DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                tissue sealant; synthetic gelatin; Vulnerary; surgical incision; angioplasty; laceration; disease transmission.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Synthetic collagen used as sealant tissue protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Chang RC, Olsen DR, Polarek JW;

                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a new method for determining collagen fragments in a body fluid which comprises contacting the sample with an immunological binding partner for the fragments, where the binding partner is immunoreactive with synthetic peptides whose sequences are essentially derived from collagen and contain potential sites for cross linking, and is incorporated as a whole antibody or its immunological fragment in an assay for quantitative determination of collagen fragments in the sample. The invention is useful for diagnosing disorders in the subject is suffering from collagen or whether a susceptible subject is suffering from collagen degradation. A test kit for quantitating the amount of collagen fragments in a body fluid is claimed. The present sequence represents the amino acid sequence of human collagen
                                                                                                                                                                                                                                                                                                     Determining collagen fragments in a body fluid sample using antibodies against synthetic peptides containing crosslinking sites is useful to diagnose collagen metabolism disorders or if a subject suffers from collagen degradation.

The present sequence is porcine alphal(III) collagen. The present invention relates to recombinant synthesis of collagens and gelatins of derived from animals. Collagen is useful in medical, pharmaceutical, food and cosmetic industries. Collagen is an important component of arterial sealants, bone grafts, drug delivery system, dermal implants, hemostats, and incontinence implants, and for treating autoimmune disorders such as rheumatoid arthritis. Collagen is useful in food products such as rheumatoid arthritis. Collagen is useful in food products such as casings, and in cosmetics or facial and skin products such as sausage casings, and in cosmetics are feating to viral infections, autoimmune diseases and cancer. Gelatin is useful in the manufacture or as a component of various pharmaceutical and manufacturing products, in food and beverage industries, in hair care and skin care products, as a glue or adhesive in various manufacturing processes, as a light-sensitive coating in various electronic devices as a photoresist base in photolithographic applications, in laboratory application, and a component in various gels used for biochemical and electrophoretic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         invention relates to recombinant synthesis of collagens and gelatins derived from animals. Collagen is useful in medical, pharmaceutical, food and coemetic industries. Collagen is an important component of arterial sealants, bone grafts, drug delivery system, dermal implants, haemostats, and incontinence implants, and for treating autoimmune disorders such as an incontinence implants, and for treating autoimmune disorders such as casings, and in cosmetics or facial and skin products such as sausage casings, and in cosmetics or facial and skin products such as sausage casings, and in fections, autoimmune diseases and cancer. Gelatin is useful in the manufacture or as a component of various pharmaceutical and medical devices and products, in food and beverage industries, in hair care and skin care products, as a glue or adhesive in various manufacturing processes, as a light-sensitive coating in various electronic devices, as photoresist base in photolithographic processes, in parinting and photographic applications, in laboratory application, and as a component in various gels used for biochemical and electrophoretic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Bovine; alphal(III) collagen; gelatin; cytostatic; viral infection; pharmaceutical; food industry; cosmetic; autoimmune disorder; vaccine; medical; arterial sealant; bone graft; dermal implant; haemostat; cancer;

The present sequence is bovine alphal(III) collagen. The present convention relates to recombinant synthesis of collagens and gelatins derived from animals. Collagen is useful in medical, pharmaceutical, food derived from animals. Collagen is an important component of arterial cand cosmetic industries. Collagen is useful information districtis, drug delivery system, dermal implants, haemostats, cand incontinence implants, and for treating autoimmune disorders such as component of arthritis. Collagen is useful in food products such as sausage constutisers. Recombinant gelatin is useful in vaccine formulations for treating viral infections, autoimmune diseases and cancer. Gelatin is cuseful in the manufacture or as a component of various pharmaceutical and care and skin care products, in food and beverage industries, in hair care and skin care products, as a glue or adhesive in various care and skin care products, as a light-sensitive coating in various
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         electronic desires, as photoresist base in photolithographic processes, in printing and photographic applications, in laboratory application, and as a component in various gels used for biochemical and electrophoretic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ovarian tumour marker gene; human; overexpression; upregulation; epithelial tumour; cancer; diagnosis; prognosis; disease monitoring; identification; serous cystadenoma; borderline serous tumour; serous cystadenocarcinoma; mucinous cystadenocarcinoma; mucinous cystadenoma; borderline mucinous tumour; endometrioid carcinoma; undifferentiated carcinoma; clear cell adenocarcinoma; cystadenofibroma; adenofibroma; serial analysis of gene expression; SAGE;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ð
                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to methods for diagnosing and prognosing ovarian tumours in an individual via the detection and measurement of the expression of ovarian tumour marker genes (ABA80181-ABA81162). ABA83180, ABA83181 and ABA83184) or segments thereof (ABA83182-ABA83189, ABA83189). ABA83181 and ABA83183). The methods of the invention are useful for detecting an ovarian tumour in a patient, for identifying an individual at increased risk for developing ovarian cancer, in prognostic tests for assessing the relative severity of ovarian cancer, in tests for monitoring a patient in remission from ovarian cancer. The methods can additionally be used to identify a particular tumour second continuous cystadenoma, borderline serous tumour, mecinous cystadenocarcinoma, endometrioid carcinoma, undifferentiated carcinoma, cystadenocarcinoma, cystadenofibroma and Brenner tumour. The ovarian tumour marker genes of the invention were identified cusing SAGE (serial analysis of gene expression) and were found to be overexpressed in a broad variety of ovarian epithelial tumour cells implicated in immune response pathways, in the regulation of cell control of an abroad variety of their use as diagnostic and control of control of call infants and in protein folding, and many of these are membrane-toward the control of their users or their secreted. In addition to their use as diagnostic and control of their are producted in marker the control of their users or their encoded.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated molecule comprising an antibody variable region which specifically binds to an extracellular domain of a ABB90749, ABB90750 and ABB90769. The antibodies which bind to TEM proteins have cytostatic, immunostimulant and antiangiogenes; a time subjects bearing a vascularised tumour prowth, necanglogenesis in subjects bearing a vascularised tumour, polycystic kidney disease, diabetic retinopathy, rheumatoid arthritis and psoriasis. Human, mouse and rat TEM genes and the encoded proteins (ABB92075-ABB92174 and ABB90721-ABB90789) are disclosed, as are marker oligonucleotide sequences: tumour endothelial markers (TEM) ABL921946-ABL92041 and ABL92143-ABL92191; normal endothelial markers (NEM) ABL92042-ABL92074; and pan-endothelial markers
                                                                                                                           antiangiogenic; tumour; neoangiogenesis; vascularised tumour; polycystic kidney disease; diabetes; retinopathy; rheumatoid arthritis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              An isolated molecule comprising an antibody variable region which specifically binds to an extracellular domain of a tumor endothelial marker (TEM) protein, useful for inhibiting tumor growth.
                                                                                                immunostimulant;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; endothelial cell; BC; tumour endothelial cell; TEM; NEM; Tumour endothelial marker; normal endothelial marker; PEM; pan-endothelial marker; polycystic kidney disease; psoriasis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                   New purified human transmembrane protein, designated as tumor endothelial marker (TEM) 3, useful for detecting, diagnosing or treating tumors, polycystic kidney disease, diabetic retinopathy, rheumatoid arthritis or
                                                                                                                                                                                                                                                                                                        The present invention relates to a novel method for the isolation of endothelial cells (ECs), and the identification of genes expressed in normal and tumour ECs. Tumour endothelial marker (TEM), normal endothelial marker (TEM), normal polynucleotide sequences encoding them are useful for detecting upplynucleotide sequences encoding them are useful for detecting, diagnosing or treating tumours as well as polycystic kidney disease, diabetic retinopathy, rheumatoid arthritis, and psoriasis. They are also useful for inhibiting neoangiogenesis or tumour angiogenesis, for inducing an immune response to tumour angiogenesis, for inducing an immune response to tumour andidatelial cells in a patient, or for identifying candidate drugs for treating tumours. The present sequence represents a human TEM or NEM protein of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a method for assessing whether a patient is afflicted with breast cancer. The method comprises comparing the level of expression of a marker (gene/polypeptide see ACC50076 to ACC50134 and ABR47386 to ABR47380 in a patient sample and the normal level of expression of the marker in a control non-breast cancer sample, where a significant increase in the level of expression of the marker in the patient sample and the normal level is an indication that the patient is afflicted with breast cancer. The breast cancer associated sequences from the present invention have cytostatic activities and can be used in gene therapy. The method is useful for diagnosing and treating breast cancer. N.B. The sequence data for this patent did not form part of the princed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Breast cancer diagnosis or treatment by comparing the level of expression of a marker in a patient sample with that in the control non-breast

The invention relates to a novel method for diagnosing and analysing autoimmune disease or arthritides. The method comprises obtaining a cutoimmune disease or arthritides. The method comprises obtaining a patient sample containing mRNA, analysing gene expression using them chat results in a gene expression signature of the mRNA, and using that gene expression signature to diagnose or analyse the autoimmune disease or arthritides in the patient, where gene expression of at least 60% of the genes correlates with that of the gene signature. The invention of the genes for targeting in the treatment of rheumatoid arthritis; identification of conter than a musus; diagnosis of rheumatoid arthritis; diagnosis or array or gene chip, specific for rheumatoid arthritis; diagnosis or analyses of autoimmune disease or rheumatoid arthritis; screening the efficacy of a candidate drug in vitro for the treatment of collagentinduced arthritis, and reducing the symptoms associated with collagentinduced arthritis. The compositions of the invention have the following correlates immunosuppressive, antirheumatic, antiathritide, such as arthritides and compositions of the present invention are useful for attributed arthritis, lupus, ankylosing spondylitis, fibrositis, chipmanatory dermatological, and immunodiatory The methods and compositions of the present invention are useful for the undiagnosing and treating to the genes used in the analysis and treatment of autoimmune disease or arthritides. This sequence relating to the genes used in the analysis and treatment of autoimmune diseases or arthritides. This sequence is not shown in the specification. It has been supplied in an electronic format from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

```
The invention relates to a novel method for diagnosing and analysing autofimmune disease or arthritides. The method comprises obtaining a contoinmune disease or arthritides. The method comprises obtaining a patient to always analysing gene expression using that that can a gene expression signature of the mRNA, and using that comprises in the patient, where gene expression of at least 60% of the genes correlates with that of the gene signature. The invention of the genes correlates with that of the meaves of an invention of the formal signature of the genes for targeting in the treatment of rheumatoid arthritis; identification of confer than a mouse; diagnosis of rheumatoid arthritis; diagnosis or array or gene chip, specific for rheumatoid arthritis; diagnosis or array or gene chip, specific for rheumatoid arthritis; diagnosis or analyses of autoimmune disease or rheumatoid arthritis; accepting the efficacy of a candidate drug in vitro for the treatment of collagentinduced arthritis. The compositions of the invention have the following activities: immunosuppressive, antirheumatic, antirities, and reading the present invention are useful for methods and compositions of the present invention are useful for diagnosing and treating autoimmune disease or arthritides, such as the compositions of the present invention are useful for the diagnosing and treating autoimmune disease or arthritides, such as the compositions of the present invention are useful for diagnosing and treating autoimmune disease or arthritides, such as the compositions of the present invention are useful for the grand disease caused by an infectious agent. This sequence is not shown to in the specification. It has been supplied in an electronic format from and to be analysis and treatment when the procession in the specification.
                                                                                                                                                                                                                                                                                               Diagnosing and analyzing autoimmune disease using gene expression profiles and microarray technology, useful for diagnosing and treating rheumatoid arthritis, lupus, fibrositis, osteoarthritis, fibromyalgia and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                BCEC; brain capillary endothelial cell; astrocyte; permeability; endothelial cell; pro-barrier; PB; microvascular permeability-modifying disorder; neurodegenerative disorder; cerebrovascular accident;

Modulating the permeability of endothelial cells, useful for treating or preventing e.g. neurodegenerative disorders, comprises altering in the endothelial cells the activity or the steady-state level of a pro-barrier

camino acid sequence naving at least 90% identity with a cialmed amino acid sequence naving at least 90% identity with a cialmed amino acid sequence naving at least 90% identity with a cid sequence selected from ADQ26047ADQ26054ADQ2605ADQ2609ADQ260A This sequence represents type III, alpha 1 collagen encoded by the COLJAI gene. This protein is upregulated in BCEC (brain capillary endothelial cells) by physical co-culture with astrocytes. This protein sequence may be used in the method of the invention for modulating the permeability of endothelial cells. The method comprises altering in the endothelial cells the activity or the steady-state level of a pro-barrier (PB) polypeptide having an amino acid sequence having at least 90% identity with a claimed having an amino acid sequence having at least 90% identity with a claimed having at least 90% identity with a claimed having at least 90% identity with a claimed having at least 90% identity with a claimed having at least 90% identity with a claimed having at least 90% identity with a claimed having at least 90% identity with a claimed having at least 90% identity with a claimed having at least 90% identity with a claimed having at least 90% identity with a claimed processed and the control of

           to balloon angioplasty, scar tissue overproduction, peripheral vascular disease, hypertension, inflammatory vasculitides, Reynaud's disease, Reynaud's phenomenon, aneurysms, arterial restenosis, thrombophlebitis, lymphangitis, lymphedema, wound healing and tissue repair, ischaemia reperfusion injury, angina, myocardial infarctions, chronic heart conditions, or osteoporosis). The PB polypeptide may also be used in the manufacture of a composition for reversibly increasing the microvascular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention comprises a method for diagnosing colon cancer in an individual, the method involves obtaining a serum sample from the individual and detecting the presence of either TIMP1 or Reg1-alpha and an additional colorectal cancer-associated marker. The method of the invention is useful for diagnosing colon cancer in an individual. The present amino acid sequence represents a human colorectal cancer-associated protein of the invention.

                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a T-lymphocyte derived from abdominal aortic tissue whic are specifically reactive with collagen I, collagen II or their fragments. The invention is useful to prevent or treat an abdominal aortic aneurysm (AAA) or rupture in a mammal. The present sequence is human collagen I alpha2 (III) fragment protein. This sequence is used in the invention.
                                                                                                                                                                                                                                                                                                                          New isolated and purified T-lymphocyte derived from abdominal aortic
tissues useful to prevent/treat an abdominal aortic aneurysm or rupture.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present provides a T-lymphocyte derived from blood in abdominal aortic aneurysm (AAA) patients which are reactive with collagen I, collagen III and their fragments. The invention is useful in diagnosis, prevention and treatment of abdominal aortic aneurysm or rupture in a mammal. The invention is also useful in the vaccine preparation. The present sequence is human collagen I alpha2 (III) fragment protein.
                                                                                                                                                                                                                                                                                                                                             diagnosis of aneurysms are reactive

The invention relates to numen tumour associated antiquing to pulpopptides, and their related nucleic acids. The TAT polypeptides are overexpressed in cancer tissues compared to normal tissues, and may thus service as effective tergets for the diagnosis and treatment of cancer in mammals. The invention also relates to nucleic acid and polypeptide and gequences at least 80% identical to the TAT nucleic acids and polypeptide and polypeptide and polypeptide and polypeptide and extoned since the TAT polypeptide; a peptide or organic molecule which binds to a TAT polypeptide; a peptide or organic molecule which binds to a TAT polypeptide; a peptide or organic molecule which binds to a TAT polypeptide; and methods and compositions for the treatment or TAT polypeptide; and methods and compositions for the treatment or diagnosis of cancer in mammals. TAT polypeptides, nucleic acids, antibodies, antagonists, binding molecules and compositions are useful for diagnosing or treating a cell proliferative disorder associated with increased TAT expression, particularly cancers such as breast cancer, colorectal cancer, lung cancer, ovarian cancer, liver cancer, bladder cancer, pancreatic cancer, ovarian cancer, liver cancer, bladder cancer, pancreatic cancer, cervical cancer, ancers of the central cancer used as hybridisation probes, in chromosome and gene mapping, in ö Gaps tumor-associated antigenic target polypeptides and nucleic acids, used as hybridisation probes, in chromosome and gene mapping, in chromosome identification and in gene therapy. The present sequence The invention relates to human tumour-associated antigenic target in preparing a medicament for treating or detecting a srative disorder, e.g. breast, lung, colorectal, ovarian or Specht T; ô 77.4%; Score 48; DB 8; Length 1466; 80.0%; Pred.                                                                                                                          cancer tissue. Also described: (1) peptides and proteins (II) containing an amino acid sequence encoded by (I); (2) a method for diagnosing an amino acid sequence encoded by (I); (2) a method for diagnosing by a sequence cancer (BC), or monitoring its progression, that uses (I), (II) or agents (2) that inhibit, or bind to, (I) or (II), labelled with a reporter; and (3) a method for treating BC that uses (I), (II) or (2). (I) and (II) are expectatic activity. (I) and (II) can be used to detect (and monitor progression of bladder cancer (BC), or the risk of developing it; to screen for specific binding agents (Z), and to treat sequence represents a human amino acid sequence associated with bladder cancer, which is used in the exemplification of the present invention.
                                                                                                            present invention describes nucleic acids (I) associated with bladder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Treating a mammal having a tumor of glial origin comprising cells that express a type A or B glial tumor antigen by contacting the cells with a composition comprising first and second binding agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention describes a method of treating a mammal having a tumor of glial origin comprising cells that express a type A or B glial tumor antigen comprisition of: a first binding agent comprising a first antibody, oligopeptide or organic molecule that binds to a type A or B glial tumor antigen; and a second
         New nucleic acids, and encoded proteins, from bladder cancer tissue, useful for diagnosis, treatment and in screening for specific binding

ö
binding agent comprising a second antibody, oligopeptide or organic molecule that binds to a type B or A glial tumor antigen. Also described is a method of determining the presence of a type A or B glial tumor in a mammal. The method is useful in treating a mammal having a tumor of glial origin comprising cells that express a type A or B glial tumor antigen. This sequence represents a human tumor-associated antigenic target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel method for characterizing the state of a neoplastic disease in a subject comprising determining the pattern of expression levels of at least 6, 8,10,15, 20, 30, 47 or 7 marker genes in a biological sample, comparing the pattern of expression levels with reference patterns of expression levels and characterizing the state of the neoplastic disease in the subject from the outcome of the comparison. The method of the invention demonstrates cytostatic applications and may be useful in characterizing the state of a neoplastic disease in a subject, preferably breast cancer, in gene therapy and for screening for sompounds having a currative effect on a neoplastic disease. The current sequence is that of the human breast cancer marker COL3A1 protein of the invention which is differentially expressed in neoplastic tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  genes in

The invention relates to detecting differential expression of one or more nucleic acid sequences (appearing as AEA04136-AEA04448 in a biological sample comprising obtaining the sample from a subject, and detecting a change in the expression level of one or more nucleic acid sequences is relative to a control expression level of the nucleic acid sequences, is new. Also included are detecting cancer (or a pre-malignant condition thereoff) in a subject (comprising comparing the expression level of one or more nucleic acid sequences in a biological sample from the subject with a control expression level of the nucleic acid sequences of at least two-fold in the expression level of the nucleic acid sequences is indicative of cancer or pre-malignant condition) in a subject (by detecting in a biological sample of the condition) in a subject (by detecting in a biological sample of the condition) in a subject (by detecting in a biological sample of the cancer or acid sequences, repeating the first step at a subsequent point in time the expression of cancer or its pre-malignant condition in the subject), determining prognosis for cancer or its pre-malignant condition in a subject (comprising detecting in a concert of the subject) is an expression level with a reference concluded sample of the subject, the expression level with a reference concluded sequences, comparing the expression level with a reference concluded sequences and evaluating the expression level with a reference concluded the subject of the subject, the expression level with a reference concluded the subject of the subject of sequences and evaluating the expression level with a reference concluded the subject of the subject of the subject of the subject of the subject of the subject of the subject of the subject of the subject of the subject of the subject of the subject of the subject of the subject of the subject of the subject of sequences and evaluating the expression level of the subject of the subject of the subject of the subject of sequences and ev
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             prognosis of the subject based on the comparison), determining the efficacy of a test compound for inhibiting cancer in a subject, determining the efficacy of a therapy for inhibiting cancer in a subject, selecting a composition for inhibiting cancer in a subject, inhibiting cancer in a subject, a polypeptide encoded by the nucleic acids above (appearing as AEA04449-AEA04541), an antibody that specifically binds to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Detecting expression of one or more nucleic acid sequences in biological sample, useful for detecting cancer, comprises detecting a change in the expression level of one or more nucleic acid sequences relative to a
                                                                                                                                                                                                                                                                                                                                                                 Tumor marker; colon tumor; cancer; cytostatic; neoplasm; diagnostic; microarray; drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Molino G;

ö
the polypeptide sequence, and detecting in a biological sample the presence of a polypeptide. The method is useful for detecting differential expression of one or more nucleic acid sequences in a biological sample, which is useful for detecting cancer (especially colon cancer), monitoring the onset, progression, or regression of cancer or a pre-malignant condition, or determining prognosis for cancer or its premalignant condition in a subject, or for determining the efficacy of a test compound for inhibiting cancer in a subject. The antibodies may also be useful treat cancer. The present sequence is a protein from a human gene over-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed setting to (II) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The

The DNA and protein sequences of the invention are useful as: markers for tissues in which the corresponding protein is preferentially expressed; as molecular weight markers on gels; as chromosome markers or tags; to identify chromosomes or to map related gene positions; and to compare with endogenous DNA sequences in patients to identify potential genetic disorders. The present amino acid sequence was used in the exemplification of the invention.
          diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this spatent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the type. Int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New polynucleotides, useful for expressing recombinant proteins for analysis, characterization or therapeutic use, or as markers for tissues in which the corresponding protein is preferentially expressed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Wang J;

Further disclosed is a DNA molecule (II) encoding (I), a procallagen molecule (III) comprising a trimer of pro-alpha chains, where the pro-alpha chain is (I). Compositions of the invention are useful in the treatment of medical conditions such as wounds or fibrotic disorders. Even if (I) has very short half-life, it can be continuously administered for treating wounds. The current sequence represents the SLPI-Collagen III amino acid sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel modified pro-alpha chain, useful for treating wound or fibrotic disorder, having triple helical forming domain linked to N-terminal domain having polypeptide of laminin glycoprotein or secretory leukocyte protease inhibitor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               C.Function:
A.Description: structural component of extracellular fibrous polymer
A.Description: structural component of extracellular matrix; glycoprotein; hydro
C.Keywords: alternative splicing; coiled coil; extracellular matrix; glycoprotein; hydro
F.1631/Product: procollagen alpha 1(XIII) chain, splice form B #status predicte
F.1-532,545-633/Product: procollagen alpha 1(XIII) chain, splice form C #status predicte
F.1-481,496-532,545-633/Product: procollagen alpha 1(XIII) chain, splice form D #status
F.1-38/Domain: non-collagenous NCI #status predicted <NCI>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A; Accession: 159133
